USER GUIDE

SUMMARY

1. INTRODUCTION
2. USER GUIDE FOR THE VERSION WITH PREDICTION
3. USER GUIDE FOR THE VERSION WITHOUT PREDICTION
4. POTENTIAL ISSUES

1-INTRODUCTION

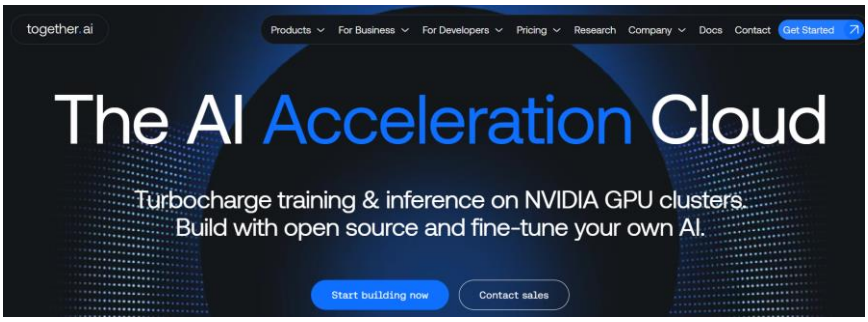
T'Handiquoi is a web interface designed for people with disabilities (primarily those facing any form of communication difficulty) who have at least one way to simulate a keyboard input (in the original project, the input was simulated by an eye blink, using either free software called EyeCommander or special glasses). The software was developed by several groups of students from CentraleSupélec, and its creation was requested by the t'Handiquoi association for the benefit of Etienne.

Two versions are made available to you here. The code is commented as much as possible, giving you the freedom to modify it as you see fit, including changing the TogetherAI API if you are not satisfied with it.

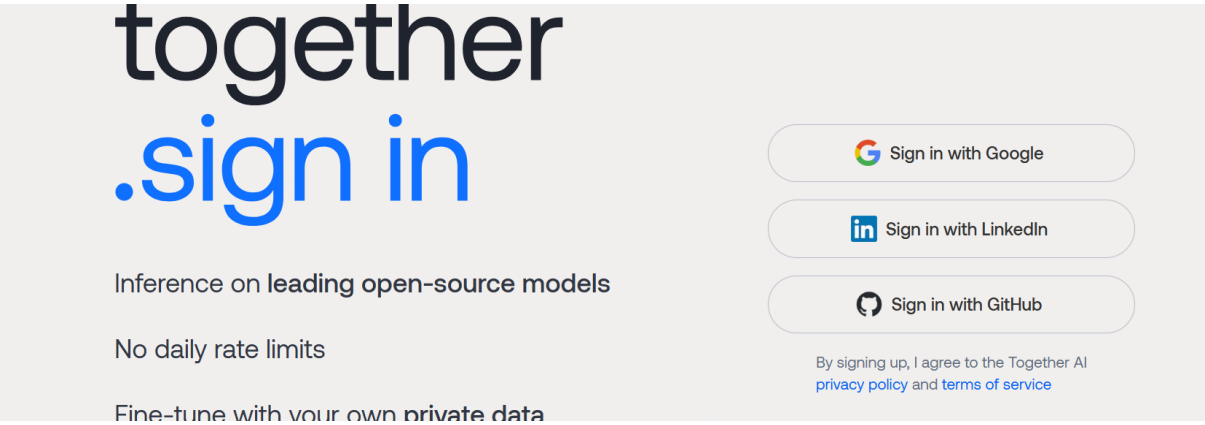
2-USER GUIDE FOR THE VERSION WITH PREDICTION

Normally, your software won't work yet if you haven't entered an API key. In this section, we outline all the steps necessary to get the software up and running. Section 2.4 is a bonus if you would like to play around with the different TogetherAI models.

2.1) Create a TogetherAI account

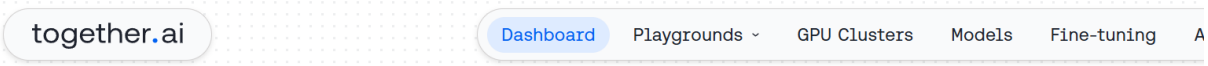


Go to the TogetherAI website (https://www.together.ai/) and create an account by clicking on "Get Started" (using a Google, LinkedIn, or GitHub account):

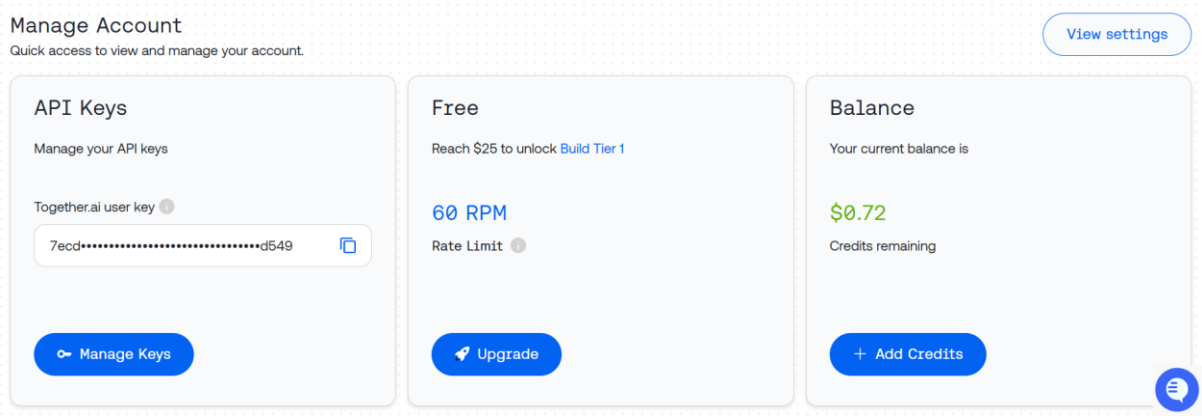


2.2) Retrieve the API key

After logging in, you will arrive at the dashboard. Make sure you are on it:



Then, scroll down to the very bottom of the page to the "Manage Account" section:



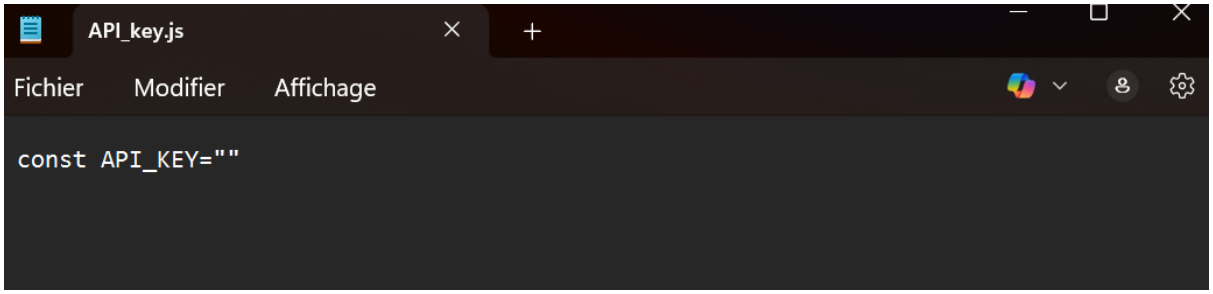
Then click on "Copy" next to the API Key. It is now copied to your clipboard, and this key is what will allow you to link the TogetherAI platform to the software running in your browser.

2.3) Link the API key to the software

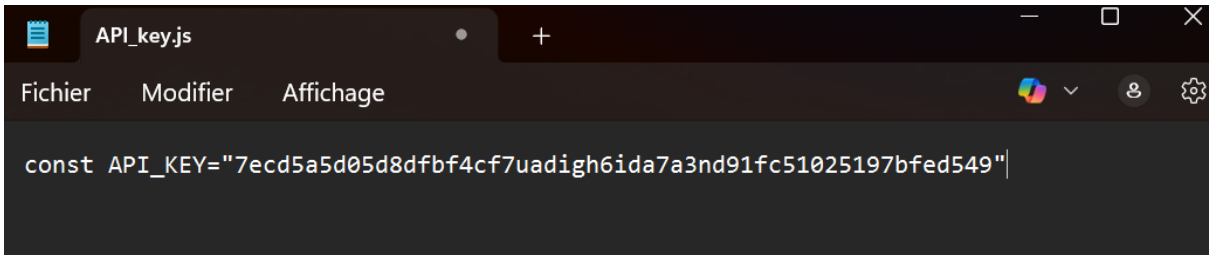
After making sure the API key is in your clipboard, go to the software folder, which should look like this:

image	13/05/2025 15:10	File folder	
API_key	22/05/2025 09:49	JavaScript Source File	1 KB
index	22/05/2025 09:48	Chrome HTML Docu...	3 KB
MODEL_choice	22/05/2025 09:49	JavaScript Source File	1 KB
script	22/05/2025 10:25	JavaScript Source File	18 KB
style	16/05/2025 09:27	CSS Source File	8 KB

Now, open the "API_key" file using "Open with" (right-click) and select a code editor or Notepad, for example. Once opened, the file will look like this:



Using CTRL+V, paste your key between the quotation marks (it is very important to keep the quotation marks around your key). It should look something like this:



WARNING: The presence of const API_KEY= is mandatory. Do not forget to save the document (CTRL+S), and the AI prediction should now be working properly.

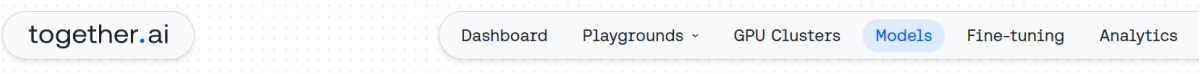
2.4) BONUS : Testing different models of TogetherAI

We give you the option to easily change prediction models using the file you saw earlier: "MODEL_choice".

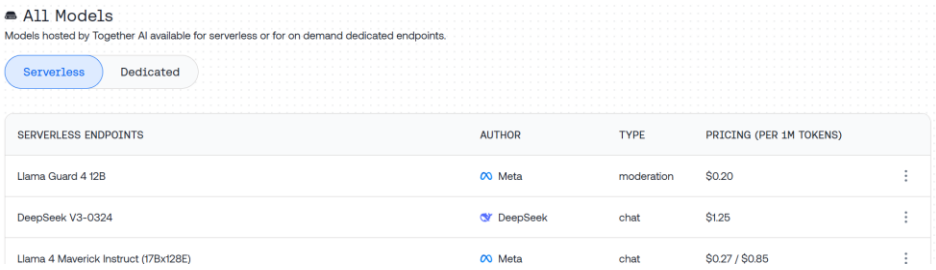
IMPORTANT : Some models are not optimized for prediction at all. Changing this file can clearly affect the quality of the predictions, but it might become necessary if the models evolve or are removed from TogetherAI...

Additionally, most of the alternative models you can choose from will require you to modify the code. A list of usable models can be found at the end of this section.

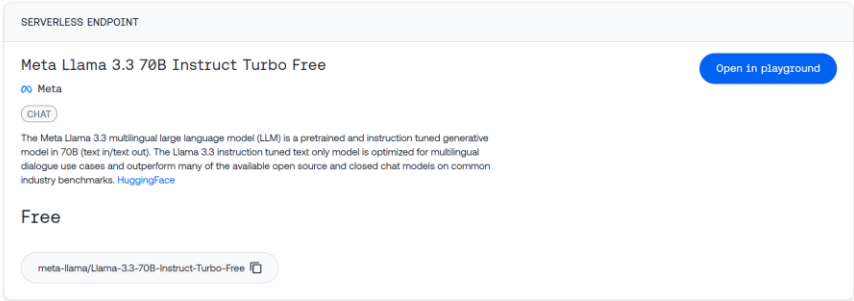
Go to the TogetherAI page titled "Models":



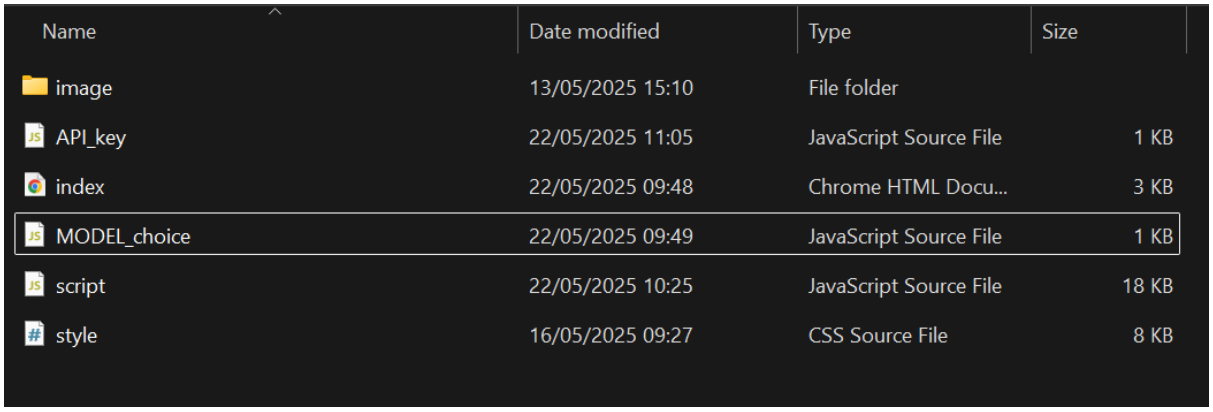
Scroll down to the "All models" section, under the "Serverless" subsection:



Now, by clicking on the names of the different models displayed, you can copy the model's ID:

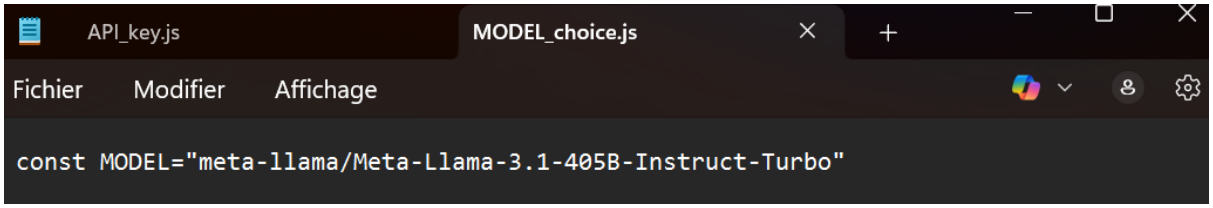


To use it in the software, open the "MODEL_choice" file in the folder:



Name	Date modified	Type	Size
image	13/05/2025 15:10	File folder	
API_key	22/05/2025 11:05	JavaScript Source File	1 KB
index	22/05/2025 09:48	Chrome HTML Docu...	3 KB
MODEL_choice	22/05/2025 09:49	JavaScript Source File	1 KB
script	22/05/2025 10:25	JavaScript Source File	18 KB
style	16/05/2025 09:27	CSS Source File	8 KB

Then, open it the same way you opened the "API_key" file, meaning with a code or text editor like Notepad, for example:



Just like you did with the API key, paste the model name between the quotation marks to replace the previous one, then save the file. This model will now generate your predictions.

EXPLANATION: If you change the model, you will notice significant changes in the prediction—sometimes slower or faster, sometimes of better quality, or sometimes truly poor (in most cases, the prediction will not work at all for several reasons that we will skip discussing here).

Models are sometimes paid and sometimes free. Keeping in mind that TogetherAI gives you a free $1 credit when you start, free models are also limited in the number of predictions per second (only 1). By default, the model is "Meta Llama 3.3 70B Instruct Turbo".

Here is a comparative table of the different models (as of May 2025):

MODEL	AVANTAGES	DISADVANTAGES
Meta Llama 3.3 70B Instruct Turbo	- Fast prediction time-bonne - Good prediction quality	- Paid, therefore limited number of requests
Meta Llama 3.3 70B Instruct Turbo Free	- Free - Good prediction quality	- Long prediction time - Max 1 request per second
DeepSeek R1 Distill Llama 70B Free	- Excellent prediction quality - Free	- Prediction time is way too long
DeepSeek R1 Distill Llama 70B	- Impossible to find a better quality/prediction time ratio	- Paid

As you can see, each model has a free version and a "paid" version. It is up to you to decide which one to use.

---

3 - USER GUIDE FOR THE VERSION WITHOUT PREDICTION

The version without prediction has no technical subtleties; it is normally ready to use immediately.

4 - POTENTIAL ISSUES

Listed here are potential problems that may arise during the software setup. This list is obviously not exhaustive, and it is possible that you may encounter more complex issues.

4.1) Display Issues

Depending on your browser, you may encounter display problems. We have no technical solutions other than advising you to install a more recent version of your browser. The software works very well on Chrome and Firefox (recent versions).

4.2) Prediction-Related Issues

These issues are the most likely to occur since the prediction feature depends entirely on the TogetherAI API. Problems you might encounter include:

- TOGETHER AI SERVER UNAVAILABILITY:

In this case, there is nothing to be done except wait for the servers to become available again. To identify this problem, you must open the console (**CTRL+SHIFT+I** on Chrome) and check the error code, comparing it to the error codes provided by Together AI (https://docs.together.ai/docs/error-codes).

- CONNECTION PROBLEMS

If your computer is not connected to the internet, the AI prediction feature will not function.

- CHANGES TO TOGETHER AI PRICING OR API

It is possible that the models offered by Together AI will evolve; some will disappear from the catalog and others will be added. To identify this problem, open the console and check the error code once again—an unavailable model will often display a 404 error code.
